

Phase 7: Inbound Order API Integration

Overview:

SmartShop CRM me ek **secure Apex REST API** banayi gayi jo e-commerce checkout se real-time Orders + Order Items create karti hai. Minimal design, standard Salesforce objects aur dedicated Integration User use hua.

7.1 API Endpoint

- URL: `/services/apexrest/smartshop/v1/orders`
 - Method: `POST` (JSON body)
 - Auth: OAuth bearer token (Integration User)
 - Feature: `clientOrderRef` se **idempotency** (duplicate prevention)
-

7.2 Payload Schema

- **Request:** clientOrderRef, account info (ExtCode/email), pricebookName, effectiveDate, channel, activate flag, items {productCode, qty, unitPrice?}
 - **Response:** orderId, linesCreated, activated, message
-

7.3 Logic & Field Mapping

- **Account:** Upsert via Ext_Code__c ya email+name
 - **Pricebook/Product:** Resolve Pricebook2 → Product2.ProductCode → PricebookEntry
 - **Order:** Draft Order create + bulk insert OrderItems
 - **Activation:** activate=true → Status = Activated → triggers automations
-

7.4 Error Handling

- 400 → Bad request (invalid product, payload error)
 - 409 → Duplicate clientOrderRef
 - 500 → Server error
-

7.5 Security

- Integration User with **least privileges**
 - OAuth via Connected App, sandbox allow list
 - No guest access
-

7.6 Testing

- Tools: Postman, Workbench
 - Positive: Minimal payload, activation works
 - Negative: Unknown product, duplicate order, oversell → correct error codes
-

7.7 Monitoring

- Debug logs for Integration User
 - API usage & response times tracked
 - Baseline throughput established
-

7.8 Deferred

- Outbound webhooks, Platform Events, CDC → Not in scope
